Looking closer at the caster wheel we can see the actual friction that must be overcome to put the robot in motion. F_w is the friction force between the wheel and the floor and F_a is the friction force between the wheel and the axle. T_w and T_a are the respective torques between the wheel and floor and the wheel and axle.

Finite-difference time-domain or Yee's method (named after the Chinese American applied mathematician Kane S. Yee, born 1934) is a numerical analysis technique used for modeling computational electrodynamics (finding approximate solutions to the associated system of differential equations). Since it is a time-domain method, FDTD solutions can cover a wide frequency range with a single ...

I'd recently bought an HP-49G+ and was terribly disappointed, both by its overall poor design and extreme complexity. I wasn't expecting much from the 39G+, but it really surprised me--especially given the low prices it's been going for lately.

1. INTRODUCTION - A transistor is a small electronic device that can cause changes in a large electrical output signal by small changes in a small input signal. That is, a weak input signal can be amplified (made stronger) by a transistor. For example, very weak radio signals in the air can be picked up by a wire antenna and processed by transistor amplifiers until they are strong enough to be ...

The transformer losses in watts are estimated and added to this sum to give a total power the primary coil must supply. The losses are from wire resistance ($I^2 R$ loss), loss in the core from magnetic hysteresis and from eddy currents. These losses are dissipated as heat.
