vector calculus in regional development analysis

In vector (or multivariable) calculus, we will deal with functions of two or three variables (usually x,y or x,y,z , respectively). The graph of a function of two variables, say, $z=f(x,y)$, lies in Euclidean space, which in the Cartesian coordinate system consists of all ordered triples of real numbers (a,b,c) .

two-dimensional vector field is a function f that maps each point (x,y) in R^2 to a two-dimensional vector hu,vi , and similarly a three-dimensional vector field maps (x,y,z) to hu,v,wi . Since a vector has no position, we typically indicate a vector field in graphical form by placing the vector $f(x,y)$ with its tail at (x,y) .

Vector Calculus in Regional Development Analysis by Kesra Nermend recommends an IT application of vector calculus for evaluating spatial regions from variables Vector Calculus in Regional Development Analysis enhances taxonomic methods for region and micro-region analysis by recommending an IT application of vector calculus. Supported by empirical research, it is using data from Polish counties.

Vector calculus, or vector analysis, is a branch of mathematics concerned with differentiation and integration of vector fields, primarily in 3-dimensional Euclidean space. The term "vector calculus" is sometimes used as a synonym for the broader subject of multivariable calculus, which includes vector calculus as well as partial differentiation and multiple integration.
