

wnt signaling in development pdf

The Wnt/ β -catenin signaling pathway is an evolutionarily conserved cell-cell communication system that is important for stem cell renewal, cell proliferation and cell differentiation both during embryogenesis and during adult tissue homeostasis.

Wnt signaling in development and tissue homeostasis

Wnt/ β -catenin has long been recognized as a major signaling pathway required for hair follicle morphogenesis, development, and regeneration. Nuclear Wnt/ β -catenin activity is observed in the DP ...

The functional spectrum of Wnt signaling in skeletal biology is getting broader and Wnt signaling has become a major field in skeletal biology. To understand the functions of the canonical Wnt signaling in skeletal development, we utilized a canonical Wnt signaling reporter mouse strain Top-Gal in which lacZ expression reflects active canonical Wnt signaling.

Wnt signaling in development and disease

In Wnt Wg signaling, presynaptic activity leads to Wg secretion, which binds to Frizzled-2 (Fz2) receptors on both pre-and post-synaptic cells (Koles and Budnik, 2012).

Wnt signaling in Development and Disease: Molecular Mechanisms and Biological Functions reviews the core topics in Wnt signaling, from molecular pathway mechanisms to its role in embryogenesis, adult tissue homeostasis, and chronic disease.

tion supported the notion that Wnt signaling was shared between vertebrates and invertebrates and, moreover, provided a rapid and convenient assay to study components of the Wnt pathway in vertebrates. ... review examines the roles of the canonical Wnt pathway in development, tissue self-renewal, and cancer.

Wnt/ β -Catenin Signaling in Development and Disease

Figure 1 Wnt signaling pathways are conserved between *Drosophila*, *C. elegans*, and vertebrates. In *Drosophila*, anterior epidermal cells (A) express Wg and signal to adjacent posterior cells (P).

MECHANISMS OF WNT SIGNALING IN DEVELOPMENT

The Wnt pathways represent key signaling networks involved in development, both in tissue specification and in cellular migration. Wnt signaling also plays key roles in tissue homeostasis in adult animals, and aberrant Wnt signaling is associated with several forms of cancer.
